THE FUTURE OF BUSINESS IN IRELAND

A conversation with SMEs
In association with Amárach

VODAFONE OPEN CONVERSATIONS
There is an overwhelmingly positive outlook on the future of the SME sector in Ireland. So, along with policy makers and government stakeholders, we must consider what conditions we can put in place to ensure this positivity and growth is protected in an uncertain global environment.

Among many emerging themes, one which stood out was attracting and retaining talent within the sector. What was clearly articulated throughout our discussions with this community is a disconnect between employers, who are trying to attract and retain talent, and employees who now expect to work in a smart or digitally-enabled environment with options around flexibility and new ways of working. We also see the impact that culture has within an organisation, and that it has a significant impact when considering or embracing change.

It would be beneficial to consider the findings presented on the future of business and build on the realisation that significant change in the Irish workplace is happening now.
**RESEARCH & METHODOLOGY**

### Quantitative Research

1. Measuring perceptions, attitudes and behaviours
2. Isolating key drivers of stakeholder support
3. Observing different stakeholder opinions

### Qualitative Research

1. Understanding attitudes and descriptions
2. Determining language and ideas and defining key terms
3. Gaining insights about issues and topics of interests

**Methodology:**

There were two elements to this research:

- **An online survey of 300 Irish employees**, working in firms with between 10-249 employees.
- **Telephone interviews with 250 Irish SME owners, managers and senior decision-makers**, with between 10-249 employees.

**Industry sector – Employees**

- Agriculture, forestry and fishing
- Arts and entertainment
- Banking, insurance and other financial services
- Charity, social enterprise or non-profit

What is smart working?

Smart working is the combined use of technology with flexibility and agility for employees to work from home, from a hub or using a hybrid model (part-home, part-office). It enables companies to grow by attracting and retaining top talent, reducing overheads, increasing productivity and allowing people to achieve a true work life balance.

Smart working also supports global challenges such as the environment, cost of living, health, lifestyle and diversity.

What do we mean by technology?

When we talk about the technology behind smart working, we mean products or services that support customer engagement and business efficiencies, including:

- Mobile, broadband and converged communications
- Cloud computing
- Artificial intelligence (AI) and robotics
- Software tools and automation
- IoT (Internet of Things)
- VR & AR (Virtual Reality and Augmented Reality)
- Data analytics (workforce analytics, talent acquisition analytics, learning and development analytics)

What do we mean by digital skills?

We mean a set of skills relating to digital technology that enable employees to work more efficiently, share information, analyse data or to engage with customers using:

- Computers and computer applications
- Tablets and smartphones
- Websites
- Other online platforms and software tools
87% of SMEs envisage growth in the next 3 years

+50% of SMEs are very confident about the future

60% of SMEs plan to increase investment in the short term, with 71% of those businesses planning to invest in staff attraction and retention

68% do see barriers to growth, 46% from Brexit

69% of SMEs will increase technology investment within the next 1-5 years

74% of SMEs said technology enables better decision making and our reliance on IT and automation results in employees adapting and gaining new skills

22% of SME employees do not feel they have the necessary digital skills for their role

77% of SMEs believe they are fully embracing smart working, 38% claim they are not considering it at all

41% of employees have smart working options available to them and are more likely to recommend their company as somewhere to work

33% of employees see it as the top priority in their current job, 50% in future roles and 34% are likely or very likely to move job for it

60% of employers and 34% of employees believe company culture is the biggest barrier to smart working

67% of SMEs believe it offers benefits to the workforce and 49% of employees feel it improves work/life balance

74% of SMEs said technology enables better decision making and our reliance on IT and automation results in employees adapting and gaining new skills

74% of SMEs said technology enables better decision making and our reliance on IT and automation results in employees adapting and gaining new skills
Introduction

This is the first in a series of Open Conversations reports on the future of business in Ireland. It has been compiled following extensive research of the SME sector. It has taken into account the views of hundreds of business owners, business management teams and employees across many industries. Vodafone Ireland has carried out interviews and surveys and engaged in a broad ranging debate at an event with industry representatives. It brought together multiple perspectives on the changing business landscape and facilitated a discussion and debate around themes such as business growth, investment, skills and training, smart working and the use of technology.

Future business growth: sentiment, investment, technology & skills

Our SME sector is vital for our economic health now and into the future. It is a diverse and vibrant sector that makes up over 95% of Irish businesses.

“I think the SME sector is hugely important for Ireland. It’s where the groups of five and ten people are employed, it’s not Dublin centric – it goes right across the country and it really represents a massive part of employment generally in Ireland.”

• Bobby Kerr, Irish Entrepreneur and Broadcaster

In terms of confidence, there is significant optimism in the sector with nearly 90% of SMEs predicting growth between now and 2021. 60% of employees are also confident in the future prospects of their company. Measures to protect this future growth are viewed as important by those in the sector but also by policy makers with the allocation of €950 million to support business and SMEs in the 2019 budget.

“The economy is growing and so is Ireland’s vital SME sector. Our own SFA research shows that small businesses are planning to invest in people, IT and equipment to stay ahead and continue to grow. However, we need to take measures to protect this growth. Whilst we’re seeing confidence amongst our members, we also see concerns around our competitiveness especially in light of Brexit. Challenges like attracting and retaining talent, increasing costs of doing business in Ireland and a tax system that puts smaller businesses at a disadvantage need to be addressed. We must support our SME sector and focus on the small businesses in Ireland so that they can fulfil their potential.”

• Sven Spollen-Behrens, Director, Small Firms Association
SMEs & Growth

87% predict growth between now and 2021

60% plan to increase investment over the next 12 months

71% of these plan to invest in staff retention & recruitment, followed by sales & IT/digital tools

68% see barriers to growth, 46% of these saying from Brexit followed by 40% from taxes and rates
Irish SMEs understand that a more connected world brings increased possibilities for growth both in Ireland, in Europe and further afield. Yet, many SMEs see the biggest growth coming from existing relationships and local markets which suggests an inward view in an uncertain global environment.

A national unemployment rate of 6% brings fresh challenges for business owners. The research finds that SMEs plan to overcome this through significant investment in staff attraction and retention in the next five years, followed by investment in technology and sales. All of these factors indicate a buoyant market that enjoys strong cash flow and access to capital.

Irish businesses are operating at a time when it is difficult to predict the effect Britain’s exit from the European Union will have on our economy and their relationship with our largest trading partner – the UK.

Irish SMEs understand that a more connected world brings increased possibilities for growth both in Ireland, in Europe and further afield. Yet, many SMEs see the biggest growth coming from existing relationships and local markets which suggests an inward view in an uncertain global environment.

Unsurprisingly, SMEs view Brexit as the greatest threat to business growth, followed by taxes and rates. Sentiment suggests the greatest challenge will be accessing new markets to supplement any blockages to the UK market.

"On Brexit, in a wider sense, people seem to think that it will be easy for a business which sells mainly to the UK, be it goods or services, to find new markets and change their business models. But in reality that is very hard to do. Brexit is a much bigger challenge than people might think."

Bobby Kerr, Irish Entrepreneur and Broadcaster

The fact that so many SMEs are planning to invest will continue to stimulate the macro economic outlook and offers both job security and opportunities for job creation.

Technology

The trajectory of technology use by businesses is increasingly pointing towards a more connected future, one in which customers expect communication and service to happen in real time with the businesses they interact with. Artificial intelligence, augmented reality and increased automation seem certain to change the landscape of business, with much uncertainty at play in the market.

Despite this, both employees and employers from SME businesses see augmented reality or virtual reality as having limited impact on the way they work – instead seeing greater automation as having the most impact going forward. This would suggest there needs to be a wider understanding on how SMEs can benefit from new, more radical but affordable technologies that can have a positive impact on their operations.

While businesses are planning to increase their investment in technology significantly in the future, there is a recognition that businesses have not fully embraced it due to lack of resources, skills and knowledge.

For me, the next technology trend Irish SMEs should think about embracing is robotic process automation, or RPA. This emerging form of business process automation involves the use of software with artificial intelligence and machine learning capabilities to handle high-volume, repeatable tasks that previously required human input. These tasks include queries, calculations and maintenance of records and transactions. The early adoption would really help businesses to stay ahead competitively and could free up resources for other areas like training and staff recruitment.”

- Pat Lucey, CEO and Co-founder, Aspira, a Cork-based consulting and IT company

What is the nature of technological impact on the workplace?

- 79% Positive impact

- 70% Happy
- 24% Neutral impact
- 7% Negative impact
- 5% All employees
Technology

69% of SMEs believe barriers do exist to fully embracing technology, including investment, skills and time.

39% of firms are ‘extremely reliant’ on technology, half expect to be ‘extremely reliant’ into the future.

31% of employees agree a lack of investment is a barrier to embracing technology.

69% plan to increase technology investment within the next 1 to 5 years, with a focus on software tools and automation.
According to the research, 59% of employees feel they have the necessary digital skills for their role, however, according to the European Commission, Ireland has one of the lowest levels of digital skills in the EU\(^1\). It is worth asking, are we focusing on the correct digital training to prepare our businesses for the future? 29% of employees surveyed see advanced IT and programming skills as the most important for the future, which is in line with skills demand coming from larger multinational tech companies, but these are not programmes generally offered at SME level. A lack of resources and time are considered the main barriers to upskilling but those surveyed agreed that digital marketing and data analytics skills are needed now and into the future.

It appears from this narrative that SME employees are conscious of the need to keep their skillsets relevant in the digital economy and will likely discriminate against employers who don’t encourage or foster an environment friendly to ongoing professional development.

---

**Skills and Training**

It is not difficult to overstate the importance of ongoing skills development and training for SME employees when it comes to future proofing their businesses. For SMEs to enjoy the confidence of their staff, they should have a plan of action for supporting ongoing training programmes.

Many companies as they expand are having problems with attracting and more recently, retaining the staff they need. When companies come to us for help, we recommend that instead of investing in bean bags and free food, that they need to invest in training the staff and making them feel valued. Staff members tell us they don’t want toys but trust. Company management say to us, ‘what if we train our staff and they leave?’ Our answer to them is ‘what if you don’t train them and they stay?’

* Noel Davidson, Director of Training, Entrepreneurs Academy

---

We are moving towards a single technology ecosystem where 20 billion devices will be connected by 2020.

This connectivity is changing working patterns as new tools and services transform the traditional workplace into a smart one. Smart working is the combined use of technology and connectivity with flexibility and agility for people to work from home, a co-working hub or using a hybrid model (part-home, part-office). With at least 216,000 people in Ireland working from home or from a co-working space, smart working is increasingly becoming a key consideration for Irish SMEs and it is predicted that over 35% of all employees will be smart working by 2022.3

Smartphones, tablets and Wi-Fi devices are all being used by staff that are smart working, whether in sales or deliveries or working from home. This connectivity is helping to create a Gigabit Society across Ireland, where smart working will become a matter of choice, rather than a function of location and broadband availability.

Technology, connectivity and the rise of co-working hubs around Ireland has paved the way for a massive increase in people’s ability and desire to smart work which is evident in the volumes registering on Abodoo. This will continue to rise as people choose to live outside cities and companies better understand the benefits of smart working.”

- Vanessa Tierney, Co-founder, Abodoo.com

1 : Attraction and Retention

Smart working is one of the most powerful practices available to help with attracting and retaining staff, particularly in areas where there is a lot of competition for the best candidates. Improved work/life balance, employee engagement and increased job satisfaction are seen as the biggest benefits of smart working, but having the technology to enable it first is considered crucial.

Research from Abodoo.com, the smart working careers platform, shows that the Irish co-working industry will double to five million locations by 2022 and that 70% of millennials want the ability to smart work, with this cohort of the population making up 75% of the workforce by 2025.
SMART WORKING: THE 4 PILLARS

Smart Working

- **77%** of employees are in favour of it, but only 9% of SMEs believe they are fully embracing it.
- **33%** of employees see it as a top priority in their current job, 50% in future roles, and 34% are likely or very likely to move job for it.
- **34%** of employees believe company culture is the biggest barrier to smart working.
- **41%** of employees have smart working options available to them. They are more likely to recommend their company as somewhere to work and are also happier in their job.
- **67%** of SMEs believe it offers benefits to the workforce, whilst 49% of employees feel smart working improves work/life balance.
As we get closer to full employment in Ireland, it is getting harder and harder to find the right employees and contracting or remote working can be a way to attract people who have recently retired, need flexibility to facilitate their families or who just don’t want a full time job in the workplace. Why aren’t we talking about flexibility around that?”

Jimmy Sheehan, Commercial Director, Contracting Plus, Expert Accountants for Professional Contractors

Interestingly, one third of the employees surveyed see smart working as a top priority in their current job. A further half would look for it in a future role and 34% are likely or very likely to move job for it – highlighting the importance of remote and flexible work practices amongst SME employees.

Would you consider moving jobs for better smart working options?

</tr>
</tbody>
</table>
2: Company Culture

Despite employee desire for it, very few Irish SMEs are seen to be fully embracing smart working. There is a reoccurring theme within the sector among both business managers and employees that company culture is a real barrier to introducing smart working.

“Going back a few years ago we put a lot of time and money into our company culture and that helped with retention. The type of people we are looking for usually have a choice between working for us or a multinational that offers attractive packages and benefits. The only way we can compete is to give employees a culture that they really enjoy and a working environment that they thrive in — and we have found that flexibility is key to that.”

• Geraldine Magnier, Director and Co-founder of Idiro Analytics

Some employers have an ‘out of sight, out of mind’ attitude to people working remotely. Their worry is that transitioning from a situation where staff are easily observable to one where they are not will result in a drop in productivity.

“If you’re at home, the thinking goes, the chances are you’re more idle than if you were sitting in an office. But you can be just as productive working from home as you are working from another setting.”

• Niamh Bushnell, Founder and CEO of research organisation TechIreland

According to some observers, it’s a serious mistake to underestimate the importance of the generational shift that is taking place as younger people age into the workforce and into management positions. It turns out there can be significant differences in terms of expectations between employers and their employees when it comes to smart working.

“Any organisation that ignores the generational shift and tries to impose the ideas of an older generation in terms of mobile working is on a hiding to nothing.”

• John Riordan, Director of Support for multinational commerce facilitator, Shopify

For those businesses that have undergone a culture change to support smart working initiatives, the results have been overwhelmingly positive. Moreover, this research shows that 52% of smart workers are women, so engaging in a smart working project can help companies build and support diversity and inclusion in their workforce.

“A few years back, I wasn’t a huge advocate of people working from home. When people wanted to work from home, my reaction was that we didn’t need them at home; we needed them in the office. I quickly reversed that hard line position when one of our best staff members decided to relocate. Through smart working we were able to keep that person’s expertise within the company. It works well and now I don’t care where staff are – depending on the role you can work from anywhere as long as the work is done to a high standard.”

• Pat Lucey, CEO and Co-founder, Aspira, a Cork-based consulting and IT company
How can smart working benefit the bottom line?

In direct contradiction to what appears to be a common belief within the sector regarding smart working and business benefits, Abodoo.com say that businesses that engage in smart working can expect to benefit by a 15% productivity uplift, as well as a 40% improvement in their staff attrition rate. It also puts the amount of euros saved per employee per annum by those companies that facilitate smart working at €9,500.4

While not every business is equally positioned to facilitate remote working, for many there are at least aspects of the employee role that can be streamlined, made less stressful and in turn more productive through the application of smart working principles.

Smart working is also just as much about being able to manage assets more effectively as it is about employees being able to work flexibly. Using converged communications that allow employees to work flexibly – businesses can manage resources much more effectively through IoT devices and greater analytics.

Having smart ways of working, particularly where employees are often field based, offers huge potential for cost savings across businesses. Worryingly, as more and more businesses begin to embrace it as the new way of operating – and realise the benefits in terms of their bottom line – organisations who are slower to adapt will find it more and more difficult to compete.

4 Based on a US study that a typical business would save $11,000 per person per year https://globalworkplaceanalytics.com/telecommuting-statistics
A CONVERSATION WITH SMEs

4: Connectivity

The power and proliferation of smart devices means that many employees already own the technology they need to do at least part of their work remotely. So having reliable connectivity to support this is important. 53% of SMEs and 60% of employees believe it is crucial for smart working. For instance, of the 62% of SMEs that saw challenges to smart working, 34% of them felt poor broadband connection hampered the introduction of smart working practices. However, only 9% of employees felt the same way.

The wider uptake of smart working is a major opportunity for many SMEs across different industries. The technology to enable smart working initiatives is becoming more and more affordable for smaller to medium sized businesses.

“Many Irish business owners are of an age where just a single computer was shared among their class, or even their whole year, in school or college. But their employees’ generation have more technology in their phones or watches than existed in a whole university a generation before. This means the people running today’s companies and engaging in digital transformation must rethink the way they do business, even if they personally don’t ‘get’ it.”

• Neil McDonnell, Chief Executive of the Irish Small to Medium Enterprise (ISME) organisation
Sentiment among both employees and employers was favourable towards the concept of smart working.

However, it was agreed that the right cultural conditions, having adequate technology, and skills and training are necessary for smart working to be fully embraced.

**Culture**

</table>
NearForm is an Irish software development company, founded in Tramore in 2011 and with operations in Dublin, London, New York and Dubai. NearForm is a key provider of open software solutions to companies embarked on digital transformation of their products and services and counts brands such as EY, Condé Nast, The New York Times, Samsung and DPD among their customers. Their team of more than 135 people is distributed in 24 countries throughout the world.

From day one, they supported growth by adopting a smart working approach. This has enabled them to hire the best people, it allows for some of the team to be based nearer clients and creates a rich diverse culture in the company. It also enables very flexible work practices so everyone enjoys a better work/life balance, with no commute and the freedom to live and work from where they want. One of the watchouts from NearForm’s experience is making sure people feel part of the NearForm family and that they understand the value of getting people together through team meetups and an annual company get-together.

NearForm has instilled work processes to ensure a collaborative environment and uses a selection of modern communications tools with video calls as a policy. Eimear O’Donoghue, HR Director with NearForm says, “Smart working is our way of life and it brings great benefits to our business, customers and our people. It fits well with our culture of trust, collaboration, diversity and quality in all that we do. We view our culture as our competitive advantage and the foundation of our continued success.”
Vodafone Ireland has undertaken this Open Conversation collaboration with SMEs to start a discussion that will go beyond this report, to their future success and also Ireland’s economic outlook.

The overall positive sentiment about the future of business in the SME sector was clear throughout this report and in the wider conversation about our economic success and innovative culture. Our economy has recovered. Our headline growth is 7.6% – outstripping our European counterparts. The Irish SME sector is expanding and contributing massively to this success.

However, the reality for many SMEs is that it is getting increasingly hard to find, hire and retain the right people to help them drive their business ambitions. At the same time, Irish employees want more flexibility in their lives; are increasingly savvy about how that can be done and are willing to change jobs to improve their work/life balance.

Companies not currently engaged in a smart working strategy would do well to ask themselves where they see their company in three to five years, can they envisage a scenario where smart working isn’t the answer to some of their business challenges and will it help create new opportunities?

At Vodafone Ireland, we believe the future is exciting. This report shows us that many SMEs view technology as key to unlocking future opportunities, engaging with customers, growing a strong base and enabling better decision making and higher productivity levels.

We see connectivity and technology at the core of enabling Irish businesses to flourish, and want to understand businesses so we can develop technology that helps achieve this goal. We want to partner with our customers to help realise their connected ambition and protect and support growth. There is a recognition across industry stakeholders that both education and a sharing of best practices among the Irish SME community is needed in a time of uncertainty but great optimism. We must create an environment of confidence that encourages businesses to invest and evaluate all options available that will allow them to achieve their business ambitions both now and into the future.
The following stakeholders attended the Future of Business in Ireland: A Conversation with SMEs event at the Iveagh Hotel where a discussion was held on the key research findings. Observations, reactions and recommendations made during the event have been captured within this report.
